

CIS 3270 Mini-Project #4: Shopping Cart

Due Date: November 20th

ABC is an online bookstore. You are with the web team of ABC. The company wants to implement a simple online shopping cart application and assigns you to design the application.

The application should be similar to that described in section 9.8 (page 281) of the text book, or the example given with the lecture. Study these examples carefully.

The shopping cart needs to allow users to

1. add books to the shopping cart,
2. view all items in the shopping cart,
3. see the total payment,
4. and remove items from the shopping cart.

You can make use of your mini-project #2. So the complete flow would be something like:

“User search form” → “Search Results with a ‘add to cart’ button or link for each result” → “shopping cart application: add (go to the search form again), remove, view, clear)”

Submission

- A screenshot of the JDeveloper environment (with the shopping cart page in design view);
- A screenshot of the shopping cart page displayed (with some items in the shopping cart) in browser;
- Complete source code, printed out separately (pasted in Word).

Note: screenshots need to be complete and original, no graphic editing. Clearly name and label all screenshots and source code.
